Sample Request (JSON or format)

Simple GET request, no headers or body was required.

API LINK : https://game-start-api-v1.onrender.com/api/games

Sample Response - Response returns too large to fit here

```
{
  "count": 898829,
  "next": "https://api.rawg.io/api/games?key=e330c42123a545c29bc3369d6f53b195&page=2",
  "previous": null,
  "results": [
    {
      "id": 3498,
      "slug": "grand-theft-auto-v",
      "name": "Grand Theft Auto V",
      "released": "2013-09-17",
      "tba": false,
```

At least **2 error cases**

Case 1 :

```
{
  "detail": "Not Found"
}
```

Case 2 :

```
Internal Server Error
```

Sample Request (JSON or format)

Simple GET request, no headers or body was required.

API LINK : https://game-start-api-v1.onrender.com/

Sample Response

```
{

    "message": "Hello, Thank you for visiting, the root url, check out other API links, Made Possible by, Fazlul, Joshua, Moh, Eitan, Fotios"

}
```

At least **2 error cases**

Case 1 :

```
{

  "detail": "Not Found"

}
```

Case 2 :

```
Internal Server Error
```

Assignment Team API Review

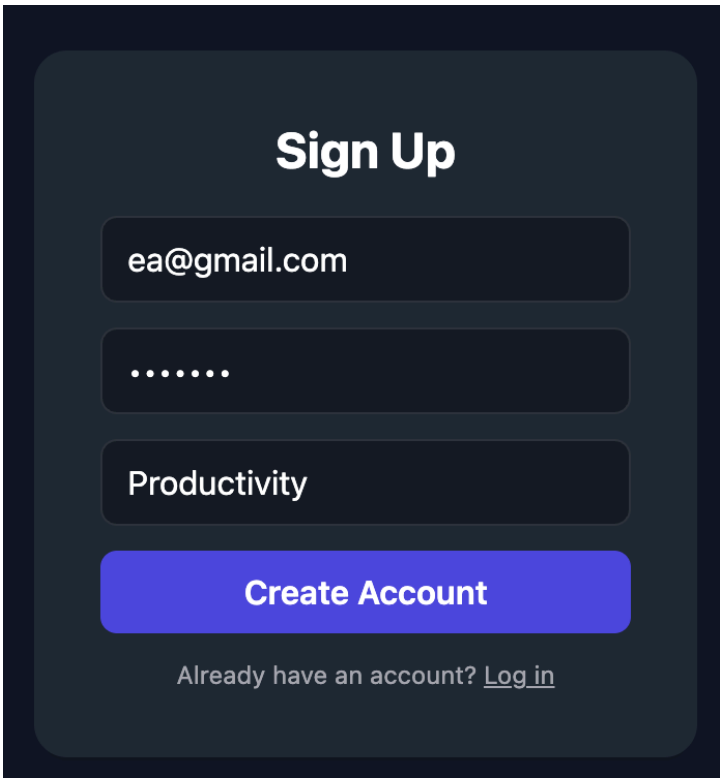
Team Run's API was very well integrated. Smooth User interface made it seamless in terms of user experience.

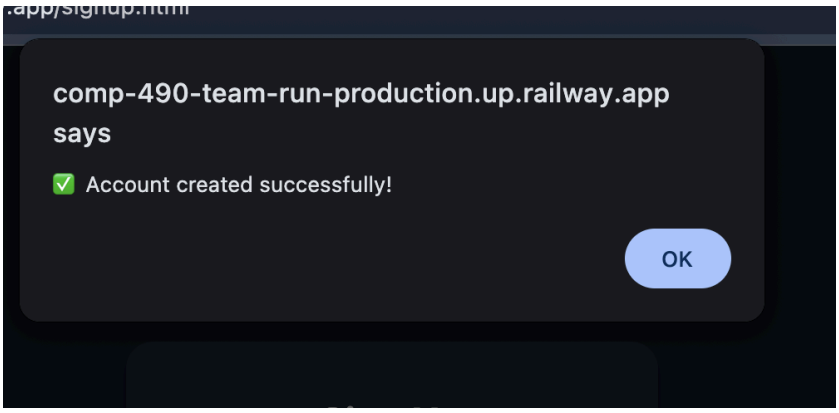
For input and output Simple username and user password was required, Any login's that were unauthorized was handled and caught up front.

Team Tested: BitByBit

APIs Tested: TeamRun

First API Tested: Registration API



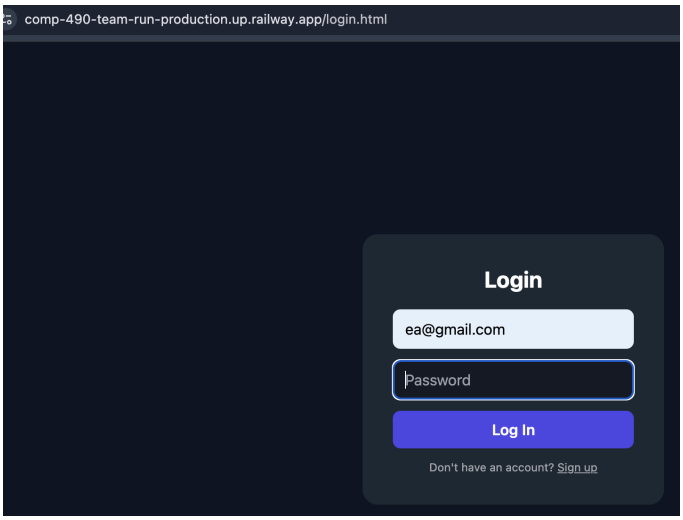


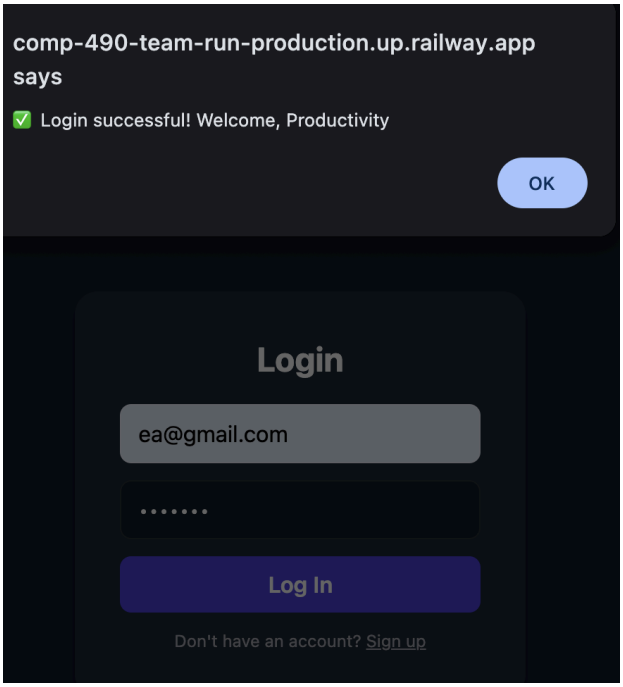
What is good: it shows whether the account was created or not

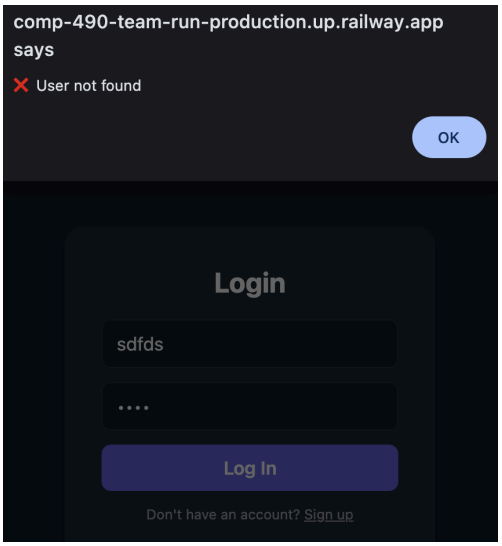
Issues found: Even if I do not have the proper email format or my password is super short still creates an account.

Suggestions for improvement: there is no email and password validation and error handling to follow the proper email format and there is also no password rules so there could be only one character as a password, which is very bad for security.

Second API: Login API







What is good: shows the proper responses. Also, shows “Welcome, Productivity”(which is my user name) showing they fetched the right account. Also, If user did not register it shows “user not found”.

Issues found: No issues were found, but the email and password validation and error handling should be addressed.

Suggestions for improvement: have an email and password validation and error handling so if the email format is incorrect or the password is too short, a registered user knows that he inputted the wrong login credentials because of incorrect format on his part, as opposed to saying “user not found” which he knows is not true. So now he knows it is the format he got wrong, not that his account is not found, which he knows is not true. This gives the user more clarity on what he did wrong, and this improves their experience.
